

FRAMEWORK FOR RESTRICTING RESOURCES CONSUMED BY GHOST AGENTS

ABSTRACT

A method for restricting resources consumed by a ghost agent can include the step of registering a ghost agent within a domain. The ghost agent can move across domains of a grid environment responsive to movements of an associated host. Once registered, a containment policy for the domain can be received by the ghost agent. The ghost agent can be configured according to the received containment policy. The containment policy can be utilized to restrict resources that are available to the ghost agent.
